Preference Trees over Combinatorial Domains

Xudong Liu

Ph.D. Candidate Advisor: Dr. Miroslaw Truszczynski

Department of Computer Science College of Engineering University of Kentucky Lexington, KY, USA Sunday, 1/10/2016

Preferences Are Ubiquitous

Figure: Preferences of different forms

Describing Preferences

Figure: How to express preferences?

- On scale of 0 to 99, how will I rate these two cars?
 - I give Car1 44 points and Car2 78 points; thus, I prefer Car2 to Car1.
- Which one to me is better than the other?
 - I prefer Car1 to Car2. (Strict preference)
 - I like Car1 and Car2 equally. (Indifference/Equivalence)
 - I cannot decide. (Incomparability)

Describing Preferences

Figure: How to express preferences?

- On scale of 0 to 99, how will I rate these two cars? (Quantitative)
 - I give Car1 44 points and Car2 78 points; thus, I prefer Car2 to Car1.
- Which one to me is better than the other? (Qualitative)
 - I prefer Car1 to Car2. (Strict preference)
 - I like Car1 and Car2 equally. (Indifference/Equivalence)
 - I cannot decide. (Incomparability)

Binary Relations

Let O be a set of elements. A binary relation R over O is a collection of ordered pairs of elements in O; that is,

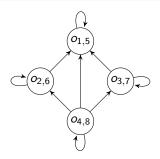

$$R \subseteq O \times O$$
.

Properties of binary relations related to preferences:

- **1** Reflexivity: $\forall o \in O$, $(o, o) \in R$.
- 2 Irreflexivity: $\forall o \in O$, $(o, o) \notin R$.
- **3** Totality: $\forall o_1, o_2, (o_1, o_2) \in R \text{ or } (o_2, o_1) \in R.$
- **1** Transitivity: $\forall o_1, o_2, o_3$, if $(o_1, o_2) \in R$ and $(o_2, o_3) \in R$, then $(o_1, o_3) \in R$.
- **3** Symmetry: $\forall o_1, o_2$, if $(o_1, o_2) \in R$, then $(o_2, o_1) \in R$.
- **1** Antisymmetry: $\forall o_1, o_2$, if $(o_1, o_2) \in R$ and $(o_2, o_1) \in R$, then $o_1 = o_2$.

Orderings

≥ is a partial preorder if it is reflexive and transitive, a total preorder if it is a partial preorder and total, a partial order if it is a partial preorder and antisymmetric, and a total order if it is a partial order and total.

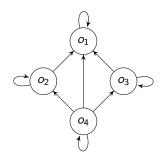

(a) partial preorder

(b) total preorder

Orderings

≥ is a partial preorder if it is reflexive and transitive, a total preorder if it is a partial preorder and total, a partial order if it is a partial preorder and antisymmetric, and a total order if it is a partial order and total.

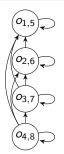

(a) partial order

(b) total order

Preference Relations

Let \succeq be a preference relation that is a total preorder over O. We say that o_1 is weakly preferred to o_2 if $o_1 \succeq o_2$, that o_1 is strictly preferred (\succ) to o_2 if $o_1 \succeq o_2$ and $o_2 \not\succeq o_1$, and that o_1 is indifferent (\approx) from o_2 if $o_1 \succeq o_2$ and $o_2 \succeq o_1$.

(a) total preorder

- $o_1 \succeq o_5$,
- $o_4 \succ o_2$,
- $o_4 \approx o_8$,
- (b) preferences

Combinatorial Domains

Combinatorial Domains

Let V be a finite set of variables $\{X_1, \ldots, X_p\}$, D a set of finite domains $\{Dom(X_1), \ldots, Dom(X_p)\}$ for each variable X_i . A combinatorial domain CD(V) is a set of outcomes described by combinations of values from $Dom(X_i)$:

$$CD(V) = \prod_{X_i \in V} Dom(X_i).$$

Combinatorial Domains: Example

Domain of cars over set V of p binary variables:

```
• BodyType: {mvan, sedan}.
```

:

$$CD(V) = \{ \langle \text{sedan, 5, blue, } \ldots \rangle, \langle \text{mvan, 7m, gray, } \ldots \rangle, \ldots \}.$$

$$2^p \text{ outcomes, too many!}$$

Combinatorial Domains: Example

Domain of cars (cf. the Car Evaluation Dataset¹)

- **1 BodyType**: {mvan, sedan, sport, suv}.
- **2** Capacity: {2, 5, 7m}.
- Color: {black, blue, gray, red, white}.
- LuggageSize: {big, med, small}.
- **Make**: {bmw, ford, honda, vw}.
- Price: {low, med, high, vhigh}.
- **Safety**: {low, med, high}.

Figure: Dominance Testing

Qualitative Preferences

Collective:

Figure: Social Choice and Welfare

Research Problems of Interest

- Preference representation formalisms to compactly model qualitative preferences over combinatorial domains.
- Preference elicitation and learning methods to cast preferences of agents in a formalism.
- Preference reasoning tasks:
 - Dominance and optimization
 - Manipulation: better off by misreporting preferences untruthfully.

Preference Modeling

Q: How do we compactly represent qualitative preferences over combinatorial domains?

- Preference Trees (P-trees)^{2,14}
- Partial Lexicographic Preference Trees (PLP-trees)⁹
- Serious Lexicographic Preference Trees (LP-trees)^{5,13}

Preference Reasoning

Q: How do we reason about preferences over combinatorial domains?

- Preference Optimization 12,13,14,15:
 - Dominance testing: $o_1 \succ_P o_2$?
 - Optimality testing: $o_1 \succ_P o_2$ for all $o_2 \neq o_1$?
 - Optimality computing: what is the optimal outcome wrt *P*?
 - Preference aggregation: which candidate wins the election?
- Preference Misrepresentation^{46,17}:
 - Manipulation

Preference Trees (P-Trees)

Let φ , ψ , and π be propositional formulas over the set \mathcal{L} of literals that are values from $\bigcup_{X_i \in V} Dom(X_i)$.

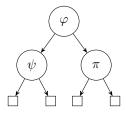

Figure: A P-tree

$$\varphi \wedge \psi \succ \varphi \wedge \neg \psi \succ \neg \varphi \wedge \pi \succ \neg \varphi \wedge \neg \pi.$$

Preference Trees (P-Trees)

Let φ , ψ , and π be propositional formulas over the set \mathcal{L} of literals that are values from $\bigcup_{X_i \in V} Dom(X_i)$.

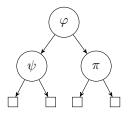

Figure: A P-tree

$$\varphi \wedge \psi \succ \varphi \wedge \neg \psi \succ \neg \varphi \wedge \pi \succ \neg \varphi \wedge \neg \pi$$
.

Total preorder

- **Output** BodyType(X_1): {mvan($x_{1,1}$), sedan($x_{1,2}$), sport($x_{1,3}$), suv($x_{1,4}$)}.
- **2** Capacity(X_2): {2, 5, 7m}.
- **3** Color(X_3): {black, blue, gray, red, white}.
- LuggageSize(X_4): {big, med, small}.
- **Make**(X_5): {bmw, ford, honda, vw}.
- **o** Price(X_6): {low, med, high, vhigh}.
- **Safety**(X_7): {low, med, high}.

Example: Preference Trees over Cars

```
BodyType(X_1): {mvan(x_{1,1}), sedan(x_{1,2}), sport(x_{1,3}), suv(x_{1,4})}. Color(X_3): {black, blue, gray, red, white}. Price(X_6): {low, med, high, vhigh}.
```

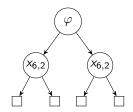

Figure : A P-tree over cars²¹

 $^{^{21}\}varphi = (x_{1,1} \wedge x_{3,5}) \vee (x_{1,2} \wedge x_{3,2}).$

Example: Preferences over Cars

BodyType(X_1): {mvan($x_{1,1}$), sedan($x_{1,2}$), sport($x_{1,3}$), suv($x_{1,4}$)}. **Color**(X_3): {black, blue, gray, red, white}. **Price**(X_6): {low, med, high, vhigh}.

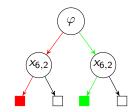

Figure : A P-tree over cars²¹ $Car2 \succ Car1$

 $^{^{21}\}varphi = (x_{1,1} \wedge x_{3,5}) \vee (x_{1,2} \wedge x_{3,2}).$

Compact Representation of P-trees

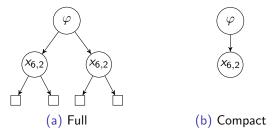

Figure: Compact P-trees

Compact Representation of P-trees

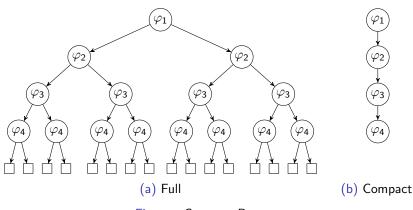

Figure : Compact P-trees

Compact Representation of P-trees

A compact P-tree over $CD(\mathcal{I})$ is a binary tree where

- lacktriangle every node is labeled with a Boolean formula over \mathcal{I} , and
- ② every non-leaf node t labeled with φ has either two outgoing edges (Figure 15a), or one outgoing edge pointing straight-down (Figure 15d), left (Figure 15c), or right (Figure 15b).

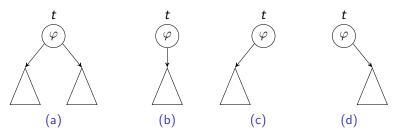

Figure: Compact P-trees

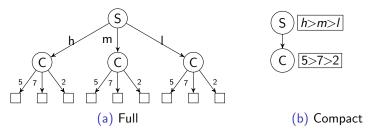

Figure: Unconditional Importance & Unconditional Preference (UIUP)

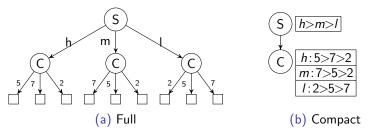

Figure: Unconditional Importance & Conditional Preference (UICP)

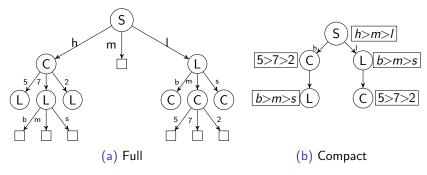

Figure: Conditional Importance & Unconditional Preference (CIUP)

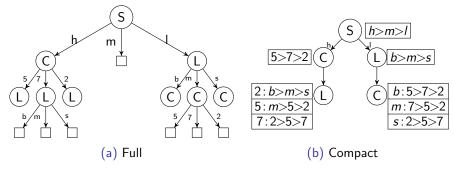

Figure: Conditional Importance & Conditional Preference (CICP)

Lexicographic Preference Trees (LP-Trees)

- **1** An LP-tree \mathcal{L} over $CD(\mathcal{I})$ is a PLP-tree, where
 - each attribute appears exactly once on every path from the root to a leaf.
 - Unlike P-trees and PLP-trees, an LP-tree induces a total order.

Outline

- The languages of P-trees, PLP-trees, and LP-trees
- Learning of preference models (PLP-trees and P-forests)
- Reasoning with preferences:
 - Preference optimization in case of P-trees
 - Computing winners and "strong" outcomes when votes are LP-trees
 - Application in trip planning
- Future research directions

Learning Problems on PLP-trees

Consistent Learning (CONSLEARN)

Given an example set \mathcal{E} , decide whether there exists a PLP-tree T (of a particular type) such that T is consistent with \mathcal{E} .

Small Learning (SMALLLEARN)

Given an example set \mathcal{E} and a positive integer I ($I \leq |\mathcal{E}|$), decide whether there exists a PLP-tree T (of a particular type) such that T is consistent with \mathcal{E} and $|T| \leq I$.

Maixmal Learning (MAXLEARN)

Given an example set $\mathcal E$ and a positive integer k ($k \le m$), decide whether there exists a PLP-tree $\mathcal T$ (of a particular type) such that $\mathcal T$ satisfies at least k examples in $\mathcal E$.

Computational Complexity

- **1** P, NP, coNP: We typically believe that $P \subset NP$ and $P \subset coNP$.
- ② Δ_2^P : P^{NP} , Σ_2^P : NP^{NP} , and Π_2^P : $coNP^{NP}$.
- 3 C-complete: hardest decision problems in class C.

Positional Scoring Rules

- *k*-approval: (1, ..., 1, 0, ..., 0) with *k* being the number of 1's and m k the number of 0's where $m = 2^p$.
- (k, l)-approval: $(a, \ldots, a, b, \ldots, b, 0 \ldots, 0)$, where a and b are constants (a > b) and the numbers of a's and b's equal to k and l, respectively.
- b-Borda: $(b, b-1, \ldots, 0)$, where if b>m-1, b-Borda is reduced to the regular Borda rule with $(m-1, m-2, \ldots, 1, 0)$.

The Evaluation and Winner Problems

The Evaluation Problem

Let r be a positional scoring rule with a scoring vector w, \mathcal{C} a class of LP-trees. Given a \mathcal{C} -profile P of n LP-trees over p attributes and a positive integer R, the *evaluation* problem is to decide whether there exists an alternative $o \in \mathcal{X}$ such that $s_w(o, P) \geq R$.

The Winner Problem

Let r be a positional scoring rule with a scoring vector w, \mathcal{C} a class of LP-trees. Given a \mathcal{C} -profile P of n LP-trees over p attributes, the winner problem is to compute an alternative $o \in \mathcal{X}$ with the maximum score $s_w(o, P)$.
