### Preference Trees over Combinatorial Domains

#### Xudong Liu

Ph.D. Candidate Advisor: Dr. Miroslaw Truszczynski

Department of Computer Science College of Engineering University of Kentucky Lexington, KY, USA Sunday, 1/10/2016

# Preferences Are Ubiquitous

Figure: Preferences of different forms

# Describing Preferences

Figure: How to express preferences?

- On scale of 0 to 99, how will I rate these two cars?
  - I give Car1 44 points and Car2 78 points; thus, I prefer Car2 to Car1.
- Which one to me is better than the other?
  - I prefer Car1 to Car2. (Strict preference)
  - I like Car1 and Car2 equally. (Indifference/Equivalence)
  - I cannot decide. (Incomparability)

# Describing Preferences

Figure: How to express preferences?

- On scale of 0 to 99, how will I rate these two cars? (Quantitative)
  - I give Car1 44 points and Car2 78 points; thus, I prefer Car2 to Car1.
- Which one to me is better than the other? (Qualitative)
  - I prefer Car1 to Car2. (Strict preference)
  - I like Car1 and Car2 equally. (Indifference/Equivalence)
  - I cannot decide. (Incomparability)

## Binary Relations

Let O be a set of elements. A binary relation R over O is a collection of ordered pairs of elements in O; that is,

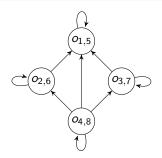

$$R \subseteq O \times O$$
.

Properties of binary relations related to preferences:

- **1** Reflexivity:  $\forall o \in O$ ,  $(o, o) \in R$ .
- 2 Irreflexivity:  $\forall o \in O$ ,  $(o, o) \notin R$ .
- **3** Totality:  $\forall o_1, o_2, (o_1, o_2) \in R \text{ or } (o_2, o_1) \in R.$
- **3** Transitivity:  $\forall o_1, o_2, o_3$ , if  $(o_1, o_2) \in R$  and  $(o_2, o_3) \in R$ , then  $(o_1, o_3) \in R$ .
- **3** Symmetry:  $\forall o_1, o_2$ , if  $(o_1, o_2) \in R$ , then  $(o_2, o_1) \in R$ .
- **1** Antisymmetry:  $\forall o_1, o_2$ , if  $(o_1, o_2) \in R$  and  $(o_2, o_1) \in R$ , then  $o_1 = o_2$ .

#### **Orderings**

≥ is a partial preorder if it is reflexive and transitive, a total preorder if it is a partial preorder and total, a partial order if it is a partial preorder and antisymmetric, and a total order if it is a partial order and total.

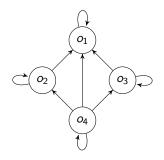

(a) partial preorder

(b) total preorder

#### **Orderings**

≥ is a partial preorder if it is reflexive and transitive, a total preorder if it is a partial preorder and total, a partial order if it is a partial preorder and antisymmetric, and a total order if it is a partial order and total.

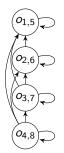

(a) partial order

(b) total order

#### Preference Relations

Let  $\succeq$  be a preference relation that is a total preorder over O. We say that  $o_1$  is weakly preferred to  $o_2$  if  $o_1 \succeq o_2$ , that  $o_1$  is strictly preferred ( $\succ$ ) to  $o_2$  if  $o_1 \succeq o_2$  and  $o_2 \not\succeq o_1$ , and that  $o_1$  is indifferent ( $\approx$ ) from  $o_2$  if  $o_1 \succeq o_2$  and  $o_2 \succeq o_1$ .

(a) total preorder

- $o_1 \succeq o_5$ ,
- $o_4 \succ o_2$ ,
- $o_4 \approx o_8$ ,
- (b) preferences

### Combinatorial Domains

#### Combinatorial Domains

Let V be a finite set of variables  $\{X_1, \ldots, X_p\}$ , D a set of finite domains  $\{Dom(X_1), \ldots, Dom(X_p)\}$  for each variable  $X_i$ . A combinatorial domain CD(V) is a set of outcomes described by combinations of values from  $Dom(X_i)$ :

$$CD(V) = \prod_{X_i \in V} Dom(X_i).$$

# Combinatorial Domains: Example

Domain of cars over set V of p binary variables:

```
• BodyType: {mvan, sedan}.
```

:

$$CD(V) = \{ \langle \text{sedan, 5, blue, } \ldots \rangle, \langle \text{mvan, 7m, gray, } \ldots \rangle, \ldots \}.$$

$$2^p \text{ outcomes, too many!}$$

# Combinatorial Domains: Example

Domain of cars (cf. the Car Evaluation Dataset<sup>1</sup>)

- **1 BodyType**: {mvan, sedan, sport, suv}.
- **2** Capacity: {2, 5, 7m}.
- Color: {black, blue, gray, red, white}.
- LuggageSize: {big, med, small}.
- Make: {bmw, ford, honda, vw}.
- Price: {low, med, high, vhigh}.
- **Safety**: {low, med, high}.

# Qualitative Preferences

#### Collective:

Figure : Social Choice and Welfare

### Research Problems of Interest

- Preference representation formalisms to compactly model qualitative preferences over combinatorial domains.
- Preference elicitation and learning methods to cast preferences of agents in a formalism.
- Preference reasoning tasks:
  - Dominance and optimization
  - Manipulation: better off by misreporting preferences untruthfully.

## Preference Modeling

Q: How do we compactly represent qualitative preferences over combinatorial domains?

- Preference Trees (P-trees)<sup>2,14</sup>
- Partial Lexicographic Preference Trees (PLP-trees)<sup>9</sup>
- Lexicographic Preference Trees (LP-trees)<sup>5,13</sup>

# Compact Representation of P-trees

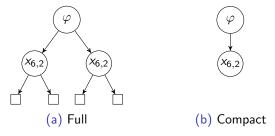

Figure: Compact P-trees

# Compact Representation of P-trees

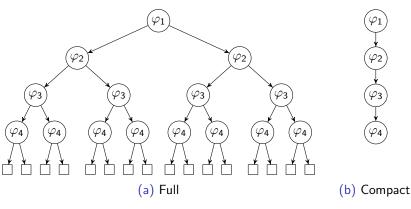

Figure: Compact P-trees

# Compact Representation of P-trees

A compact P-tree over  $CD(\mathcal{I})$  is a binary tree where

- lacktriangle every node is labeled with a Boolean formula over  $\mathcal{I}$ , and
- ② every non-leaf node t labeled with  $\varphi$  has either two outgoing edges (Figure 15a), or one outgoing edge pointing straight-down (Figure 15d), left (Figure 15c), or right (Figure 15b).

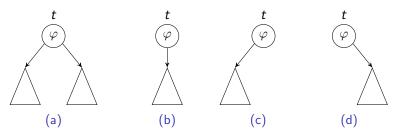

Figure: Compact P-trees

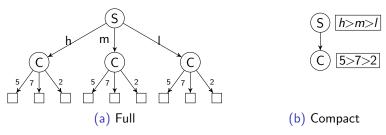

Figure: Unconditional Importance & Unconditional Preference (UIUP)

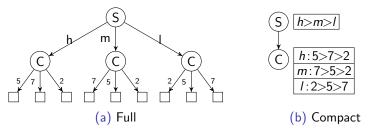

Figure: Unconditional Importance & Conditional Preference (UICP)

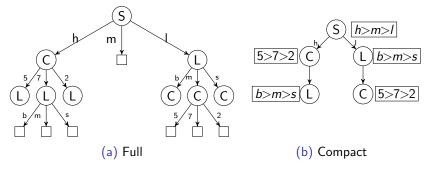

Figure: Conditional Importance & Unconditional Preference (CIUP)

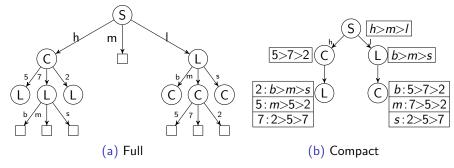

Figure: Conditional Importance & Conditional Preference (CICP)

# Lexicographic Preference Trees (LP-Trees)

- **1** An *LP-tree*  $\mathcal{L}$  over  $CD(\mathcal{I})$  is a PLP-tree, where
  - each attribute appears exactly once on every path from the root to a leaf.
  - Unlike P-trees and PLP-trees, an LP-tree induces a total order.

## Outline

- The languages of P-trees, PLP-trees, and LP-trees
- 2 Learning of preference models (PLP-trees and P-forests)
- Reasoning with preferences:
  - Preference optimization in case of P-trees
  - Computing winners and "strong" outcomes when votes are LP-trees
  - Application in trip planning
- Future research directions

## Learning Problems on PLP-trees

## Consistent Learning (CONSLEARN)

Given an example set  $\mathcal{E}$ , decide whether there exists a PLP-tree T (of a particular type) such that T is consistent with  $\mathcal{E}$ .

## Small Learning (SMALLLEARN)

Given an example set  $\mathcal{E}$  and a positive integer I ( $I \leq |\mathcal{E}|$ ), decide whether there exists a PLP-tree T (of a particular type) such that T is consistent with  $\mathcal{E}$  and  $|T| \leq I$ .

## Maixmal Learning (MAXLEARN)

Given an example set  $\mathcal E$  and a positive integer k ( $k \le m$ ), decide whether there exists a PLP-tree  $\mathcal T$  (of a particular type) such that  $\mathcal T$  satisfies at least k examples in  $\mathcal E$ .

# Computational Complexity

- **1** P, NP, coNP: We typically believe that  $P \subset NP$  and  $P \subset coNP$ .
- ②  $\Delta_2^P$ :  $P^{NP}$ ,  $\Sigma_2^P$ :  $NP^{NP}$ , and  $\Pi_2^P$ :  $coNP^{NP}$ .
- 3 C-complete: hardest decision problems in class C.

## Positional Scoring Rules

- *k*-approval: (1, ..., 1, 0, ..., 0) with *k* being the number of 1's and m k the number of 0's where  $m = 2^p$ .
- (k, l)-approval:  $(a, \ldots, a, b, \ldots, b, 0 \ldots, 0)$ , where a and b are constants (a > b) and the numbers of a's and b's equal to k and l, respectively.
- b-Borda:  $(b, b-1, \ldots, 0)$ , where if b>m-1, b-Borda is reduced to the regular Borda rule with  $(m-1, m-2, \ldots, 1, 0)$ .

#### The Evaluation and Winner Problems

#### The Evaluation Problem

Let r be a positional scoring rule with a scoring vector w,  $\mathcal{C}$  a class of LP-trees. Given a  $\mathcal{C}$ -profile P of n LP-trees over p attributes and a positive integer R, the *evaluation* problem is to decide whether there exists an alternative  $o \in \mathcal{X}$  such that  $s_w(o, P) \geq R$ .

#### The Winner Problem

Let r be a positional scoring rule with a scoring vector w,  $\mathcal{C}$  a class of LP-trees. Given a  $\mathcal{C}$ -profile P of n LP-trees over p attributes, the winner problem is to compute an alternative  $o \in \mathcal{X}$  with the maximum score  $s_w(o, P)$ .
